

JOINT PLANNING ENGINE

J P E

The Joint Planning Process, executed — not remembered.

From initiation to the signed order — with an assistant that runs on your own network.

THE PROBLEM

JPP is executed today across slide decks, shared drives, and Word templates. Under time pressure doctrinal steps get skipped, staff products lose traceability to the governing publication, and hard-won planning knowledge walks out the door at PCS season.

THE APPROACH

One workspace covering all seven JPP steps, where every field, checklist, and gate cites the JP 5-0 paragraph or figure it derives from. Doctrine is enforced by the tool rather than recalled by the planner under a compressed timeline.

JOINT PLANNING PROCESS — 7-STEP PIPELINE

INITIATION TO ORDER

BY THE NUMBERS

EVERY FIGURE COUNTED FROM THE SHIPPING PRODUCT

CAPABILITY HIGHLIGHTS

■ A planning assistant that never leaves your network

Drafts a COA, critiques one against the five validity criteria, and pulls specified and implied tasks out of an uploaded order — running against a model on your own hardware, so planning data never leaves the building. Nothing is written without the planner accepting it.

■ Reads the orders you already have

PDF, Word, PowerPoint, plain text, and photographed or scanned pages. A printed order that cannot be copied and pasted becomes a task list sorted into specified, implied and essential — without anyone retyping it.

■ Enforced doctrinal gates

A COA failing any of the five validity criteria — suitable, feasible, acceptable, distinguishable, complete — is flagged for rejection or revision before it can advance.

■ Every product leaves the tool

28 staff products — WARNORD, CCIRs, sync matrix, decision statement, TPFDD and more — copy to the clipboard or download, each classification-marked.

WHY IT MATTERS

WHAT STAFFS GET BACK

DEPLOYMENT & THE AIR GAP

- Planning, ingestion and inference make no external call
- Inference on your own hardware; nothing sent to a commercial API
- Browser-based — no client install
- Sign-in uses Google SSO today; swappable for a disconnected network

PROGRAM STATUS

Prototype under active development. All seven JPP steps are functional, with the local-inference assistant and document ingestion in the shipping build. The application is instrumented for a measured evaluation of planning time and product completeness; no results are claimed yet. All demonstration scenarios are notional. Not accredited and operating under no ATO. Not an official U.S. Department of Defense product or endorsement.
